

AutoML and Explainable Al

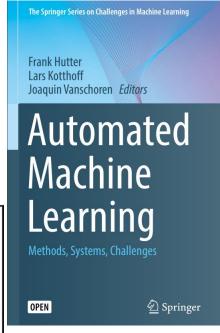

Assoc. Prof. Karl Ezra Pilario, Ph.D.

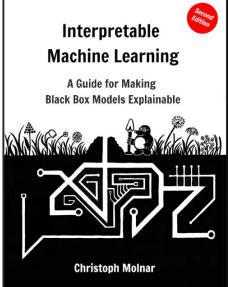

Process Systems Engineering Laboratory
Department of Chemical Engineering
University of the Philippines Diliman

Outline

- AutoML Packages
 - Lazy Predict
 - Auto-sklearn
 - Optuna
 - TPOT
 - PyCaret
- Explainable AI (XAI)
 - Definitions and Concepts
 - Permutation Feature Importance
 - Drop-column Feature Importance
 - Mean-Decrease-in-Impurity
 - Shapley Additive Explanations

Hutter, Kotthoff, Vanschoren (2019)

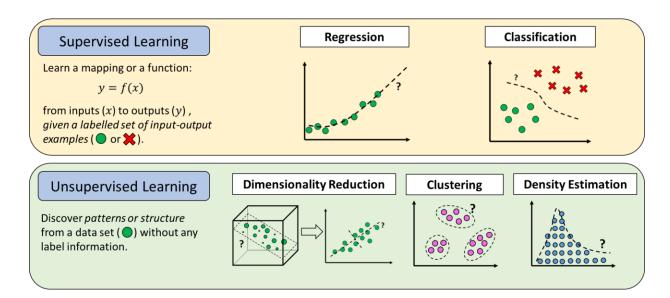

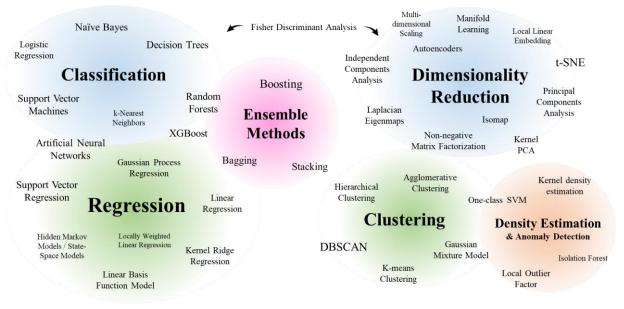

Molnar (2022)

AutoML

- Automatically discover best-performing models with little user involvement.
- For model comparison, AutoML offers a single hyperparameter optimization toolkit for all models.
- Meta-learning: Learning to Learn
 - The science of systematically observing how different ML approaches perform on a wide range of tasks, then learning from this experience to improve ML itself.
- CASH: Combined Algorithm Selection and Hyperparameter Optimization (Kotthoff et al., 2019)
 - Automatically and simultaneously choosing a learning algorithm and setting its hyperparameters to optimize empirical performance.

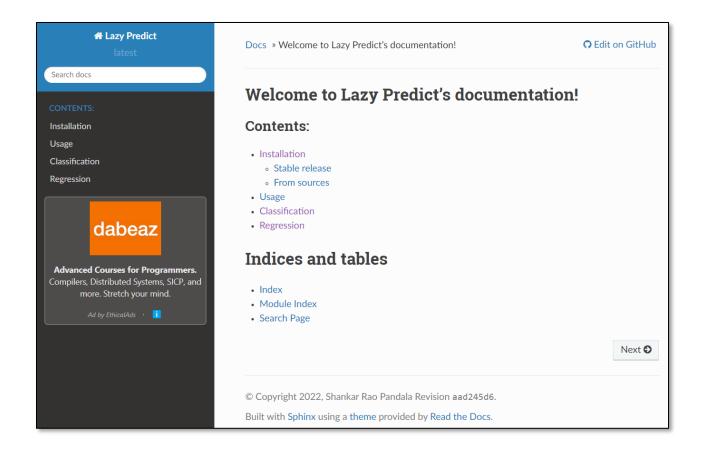

Lazy Predict

- Shankar Rao Pandala (Last Update: 2022)
- https://github.com/shankarpandala/lazypredict/tree/master
- https://lazypredict.readthedocs.io/en/latest/

- Fits a number of scikit-learn models on the data with default settings for all.
- Results: Accuracy, R2, F1-score, etc.
- No automatic model selection nor hyper-parameter tuning.
- For classification or regression only.

Lazy Predict

Example:

Use LazyClassifier on the **Breast Cancer Data Set** (this is the example from the website)

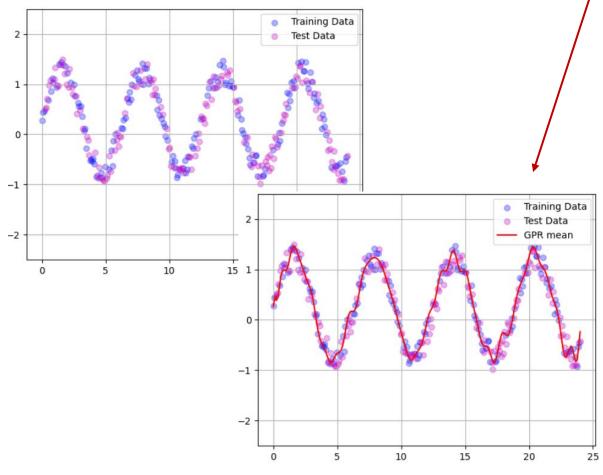

Ranked by Accuracy

Auto-Sklearn

- Feurer et al. (2015) and Feurer et al. (2022)
- https://automl.github.io/auto-sklearn/master/
- For regression and classification with pre-processing.
- A total of 110 tunable hyper-parameters across all models (2015).
- Can discover ensembles.
- Uses Bayesian Optimization and meta-learning.

Efficient and Robust Automated Machine Learning

Abstract

The success of machine learning in a broad range of applications has led to an ever-growing demand for machine learning systems that can be used off the shelf by non-experts. To be effective in practice, such systems need to automatically choose a good algorithm and feature preprocessing steps for a new dataset at hand, and also set their respective hyperparameters. Recent work has started to tackle this automated machine learning (AutoML) problem with the help of efficient Bayesian optimization methods. Building on this, we introduce a robust new AutoML system based on scikit-learn (using 15 classifiers, 14 feature preprocessing methods, and 4 data preprocessing methods, giving rise to a structured hypothesis space with 110 hyperparameters). This system, which we dub AUTO-SKLEARN, improves on existing AutoML methods by automatically taking into account past performance on similar datasets, and by constructing ensembles from the models evaluated during the optimization. Our system won the first phase of the ongoing ChaLearn AutoML challenge, and our comprehensive analysis on over 100 diverse datasets shows that it substantially outperforms the previous state of the art in AutoML. We also demonstrate the performance gains due to each of our contributions and derive insights into the effectiveness of the individual components of AUTO-SKLEARN.

Optuna

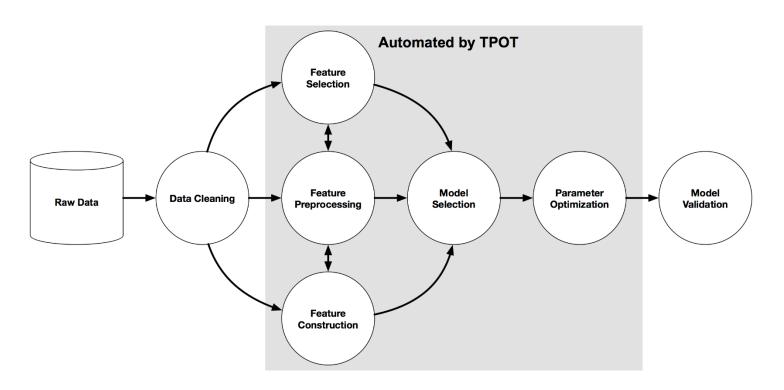

- Akiba et al. (2019)
- Suitable for CASH (algorithm selection + hyper-parameter tuning)
- Models and hyper-parameters are user-defined.
- Uses Bayesian Optimization.

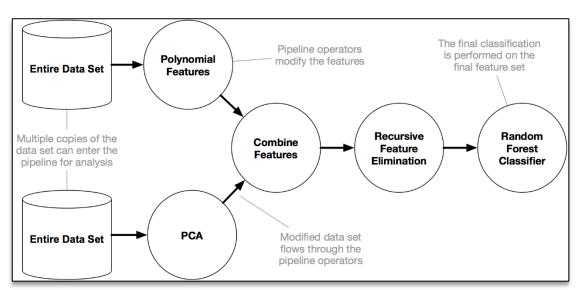

TPOT

- Olson and Moore (2016)
- http://epistasislab.github.io/tpot/
- TPOT = Tree-based Pipeline Optimization Tool
- TPOT optimizes machine learning pipelines using genetic programming.

Sample Result:

PyCaret

- Moez Ali (2020)
- https://pycaret.gitbook.io/docs/
- low-code library: replace hundreds of lines of code with a few lines only.

Example: Regression

```
# Regression Functional API Example
# loading sample dataset
from pycaret.datasets import get_data
data = get_data('insurance')
# init setup
from pycaret.regression import *
s = setup(data, target = 'charges', session_id = 123)
# model training and selection
best = compare_models()
# evaluate trained model
evaluate_model(best)
# predict on hold-out/test set
pred_holdout = predict_model(best)
# predict on new data
new_data = data.copy().drop('charges', axis = 1)
predictions = predict_model(best, data = new_data)
# save model
save_model(best, 'best_pipeline')
```

Example: Classification

PYCARET

low-code

machine

learning

PyCaret is an open-source, low-code

machine learning library in Python that automates machine learning workflows.

```
. . .
# Classification Functional API Example
# loading sample dataset
from pycaret.datasets import get_data
data = get_data('juice')
# init setup
from pycaret.classification import *
s = setup(data, target = 'Purchase', session_id = 123)
# model training and selection
best = compare_models()
# evaluate trained model
evaluate_model(best)
# predict on hold-out/test set
pred_holdout = predict_model(best)
# predict on new data
new_data = data.copy().drop('Purchase', axis = 1)
predictions = predict_model(best, data = new_data)
# save model
save_model(best, 'best_pipeline')
```

Example: Anomaly Detection

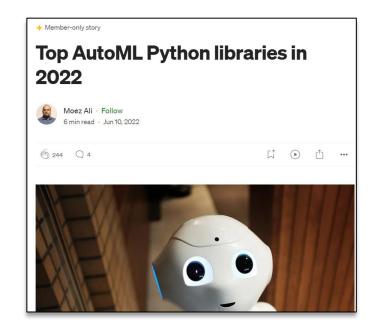

```
# Anomaly Detection Functional API Example
# loading sample dataset
from pycaret.datasets import get data

Abstract—This paper presents a benchmark of supervised Automated Machine Learning (AutoML) tools. Firstly, we analvze the characteristics of eight recent open-source AutoML tools (Auto-Keras, Auto-PyTorch, Auto-Sklearn, AutoGluon, H2O AutoML, rminer, TPOT and TransmogrifAI) and describe twelve popular OpenML datasets that were used in the benchmark (divided into regression, binary and multi-class classification tasks). Then, we perform a comparison study with hundreds of computational experiments based on three scenarios: General Machine Learning (GML), Deep Learning (DL) and XGBoost (XGB). To select the best tool, we used a lexicographic approach, nsidering first the average prediction score for each task and

algorithm selection; Deep Learning (DL) selection and XG-Boost (XGB) hyperparameter tuning. Each tool is measured in terms of its predictive performance (using an external 10-fold cross-validation) and computational cost (measured in terms of time elapsed). Moreover, the best AutoML tools are further compared with the best public OpenML predictive results (which are assumed as the "gold standard").

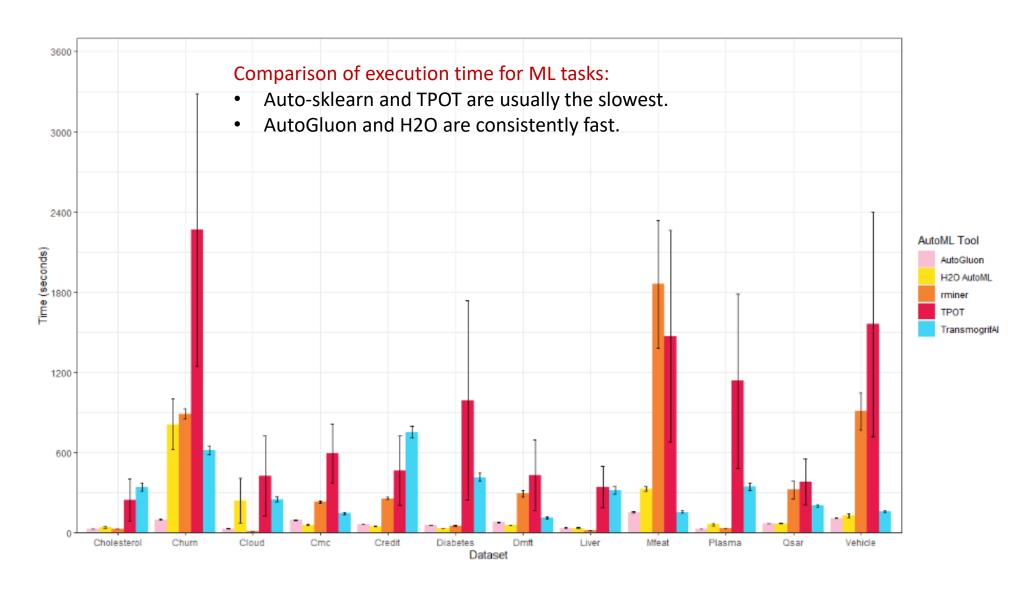

The paper is organized as follows. Section 2 presents the related work. Next, Section 3 describes the AutoML tools and datasets. Section 4 details the benchmark design. Then,

- In this work, the authors compared 8 different AutoML tools (see Table).
- Twelve different OpenML data sets were used to benchmark the AutoML tools.
 - Binary classification
 - Multi-class classification
 - Regression

Comparison of AutoML Libraries

Comparison of AutoML Libraries

Comparison of performance for ML tasks:

- For binary classification,
 TransmogrifAI is best for 3 out of 4 data sets.
 AutoGluon and Auto-sklearn produced the worst overall results.
- For multi-class classification,
 AutoGluon and Auto-sklearn are best.
- For regression, differences between tools are not that significant. But the best overall is rminer.

IBM

What is explainable AI (XAI)?

Explainable artificial intelligence (XAI) is a set of processes and methods that allows human users to **comprehend and trust** the results and output created by machine learning algorithms. Explainable AI is used to describe an AI model, its expected **impact** and **potential biases**. It helps characterize model **accuracy**, **fairness**, **transparency** and outcomes in AI-powered decision making.

Explainable AI is crucial for an organization in building trust and confidence when putting AI models into production. AI explainability also helps an organization adopt a **responsible** approach to AI development.

ISO/IEC TR 29119-11:2020

Software and systems engineering

Software testing

Part 11: Guidelines on the testing of Al-based systems

Status: Published

→ This standard will be replaced by ISO/IEC AWI TS 29119-11

Abstract

This document provides an introduction to Al-based systems. These systems are typically complex (e.g. deep neural nets), are sometimes based on big data, can be poorly specified and can be non-deterministic, which creates new challenges and opportunities for testing them.

Source: https://www.iso.org/obp/ui/en/#iso:std:iso-iec:tr:29119:-11:ed-1:v1:en

According to an ISO Standard, the following terms are defined:

Artificial Intelligence

The capability of an engineered system to acquire, process, and apply knowledge and skills.

Machine Learning

A process using computational techniques to enable systems to learn from data or experience.

AI-based System

A system including one or more components implementing AI.

Explainability

Level of understanding of how the AI-based system came up with a given result.

Interpretability

Level of understanding of how the underlying (AI) technology works.

Transparency

Level of accessibility to the algorithm and data used by the AI-based system.

Understandability

Ability of a model to make a human understand its *internal structure* and how it works *algorithmically*.

Comprehensibility

Ability of a learning algorithm to represent its learned knowledge in a human understandable fashion.

Interpretability

Refers to how accurate a machine learning model can associate a cause to an effect.

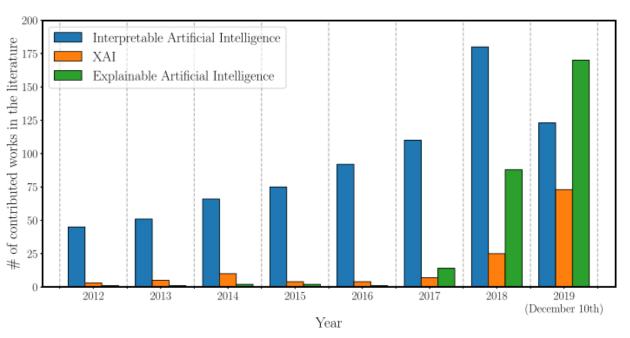

Transparency

A model is transparent if, by itself, it is already understandable.

Explainability

Ability of a model to explain its results to humans:

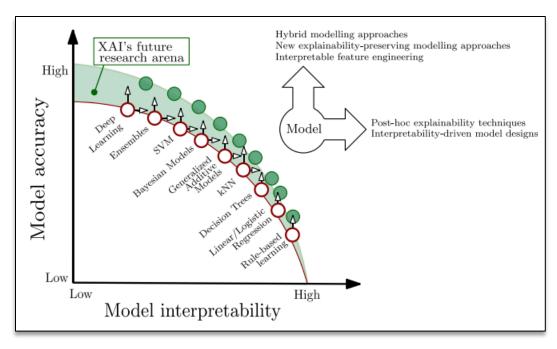

- How did it arrive at its decisions?
- Which inputs in the data prompted the decision to change?
- Which features have a significant effect on the prediction?

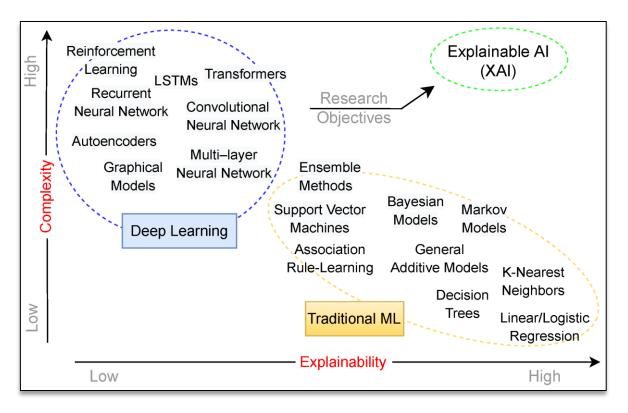

Number of Papers in Literature that mentioned XAI

- It is said that traditional ML models are explainable, but are low-performing.
- On the other hand, deep learning models are not explainable but high-performing.
- Explainable AI aims to provide models that are *explainable yet high-performing*.

ABSTRACT

The proposed EU regulation for Artificial Intelligence (AI), the AI Act, has sparked some debate about the role of explainable AI (XAI) in high-risk AI systems. Some argue that black-box AI models will have to be replaced with transparent ones, others argue that using XAI techniques might help in achieving compliance. This work aims to bring some clarity as regards XAI in the context of the AI Act and focuses in particular on the AI Act requirements for transparency and human oversight. After outlining key points of

ARTICLE Part of Section 2: Requirements for High-Risk AI Systems

Article 13: Transparency and Provision of Information to Deployers

Feedback - We are working to improve this tool. Please send feedback to Risto Uuk at risto@futureoflife.org

- 1. High-risk AI systems shall be designed and developed in such a way to ensure that their operation is sufficiently transparent to enable deployers to interpret the system's output and use it appropriately. An appropriate type and degree of transparency shall be ensured with a view to achieving compliance with the relevant obligations of the provider and deployer set out in Section 3 of this Title.
- 2. High-risk AI systems shall be accompanied by instructions for use in an appropriate digital format or otherwise that include concise, complete, correct and clear information

ARTICLE Part of Section 2: Requirements for High-Risk AI Systems

Article 14: Human Oversight

Feedback - We are working to improve this tool. Please send feedback to Risto Uuk at risto@futureoflife.org

- 1. High-risk AI systems shall be designed and developed in such a way, including with appropriate human-machine interface tools, that they can be effectively overseen by natural persons during the period in which the AI system is in use.
- 2. Human oversight shall aim at preventing or minimising the risks to health, safety or fundamental rights that may emerge when a high-risk AI system is used in accordance with its intended purpose or under conditions of reasonably foreseeable misuse, in particular when such risks persist notwithstanding the application of other requirements set out in this Section.
- 3. The oversight measures shall be commensurate to the risks, level of autonomy and context of use of the AI system and shall be ensured through either one or all of the

Intrinsically Explainable

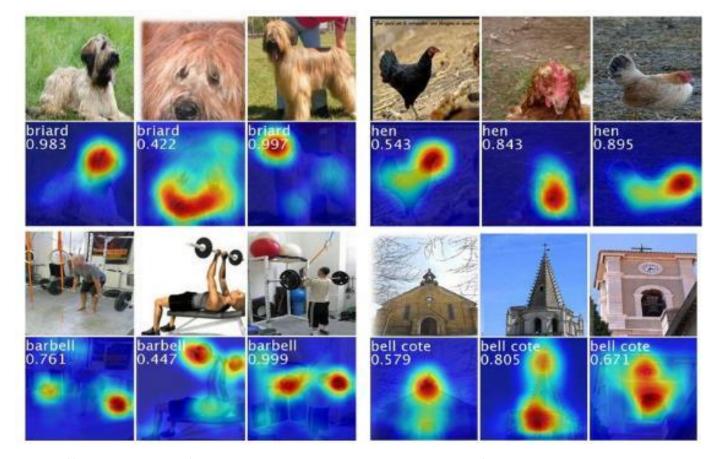

Some models are explainable / interpretable on their own.

Some examples of **post-hoc explainability** methods:

- Visual explanation
- Saliency maps (images)
- Model simplification
- Uncertainty Quantification
- Look at the Features!
 - Feature Importance
 - Feature Relevance
 - Feature Attribution
 - Feature Significance

Post-hoc Explainability

If an ML model is not transparent, additional analysis must be done *after training the model* in order to provide an explanation.

https://debuggercafe.com/saliency-maps-in-convolutional-neural-networks/

ML explainers can be categorized into:

Model-specific Explainers

The explainability method is only applicable to a certain ML model only.

VS.

Model-agnostic Explainers

The explainability method is applicable to any ML model.

Local Explainers

An explanation is provided for a specific data sample only.

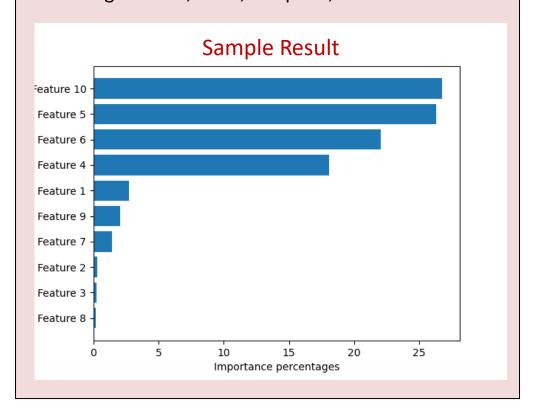

VS.

Global Explainers

An explanation is provided for the model behavior across the entire data space.

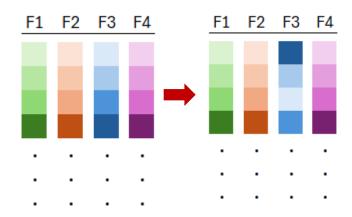

Feature Importance

- A mechanism to identify features that have the most relevant impact to the model predictions.
- Typically model-agnostic; can be local or global
- Packages: LIME, SHAP, DeepLIFT, etc.

Permutation Feature Importance (PFI)

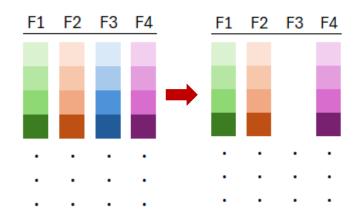

- PFI is defined as the decrease in the model score when a single feature value is randomly shuffled.
- If 2 or more features are correlated, PFI is biased to give them lower importance.

F3 is most important if it gave the largest drop in accuracy.

Drop-Column Feature Importance

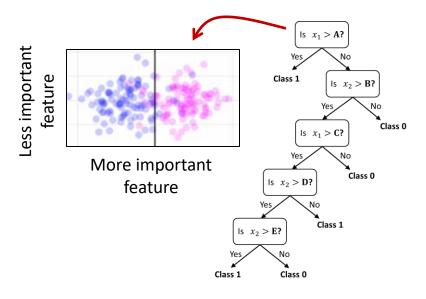

- Defined as the decrease in the model score when a single feature is removed from the data set.
- Requires model to be re-trained.
 Hence, it is not purely a post-hoc explainer.

F3 is most important if it gave the largest drop in accuracy.

Mean-Decrease-in-Impurity Feature Importance

- Applicable to tree-based models only (e.g. Random Forest, Decision Tree)
- "Decrease in impurity" quantifies the fraction of the samples a feature contributes to.

Shapley Additive Explanations (SHAP)

- Uses "Shapley values" from coalitional game theory.
- Feature importance, I_i , is computed as:

$$I_j = \sum_{i=1}^n \left| \phi_j^{(i)} \right|$$

where ϕ is the Shapley value (contribution of the jth feature at the ith sample).

- Calculation of the Shapley value involves iterating over all possible subsets of the feature set, then checking the changes in the model score.
- Computation time grows exponentially with the number of features. Hence, we can approximate the Shapley value using only local samples → Kernel SHAP.

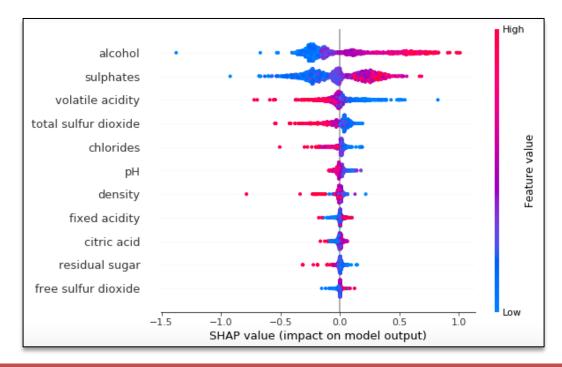

Shapley values are calculated as:

$$\phi_j = \sum_{S \in J} \frac{|S|! \ (|F| - |S| - 1)!}{|F|!} [f_{S \cup j}(\mathbf{x}_{S \cup j}) - f_S(\mathbf{x}_S)]$$

F = set of all input featuresS = coalition which is a subset of F

 $|\cdot|$ = cardinality of the set

 $f_{S \cup j}(x_{S \cup j}) - f_S(x_S)$ = marginal contribution of feature j in coalition S.

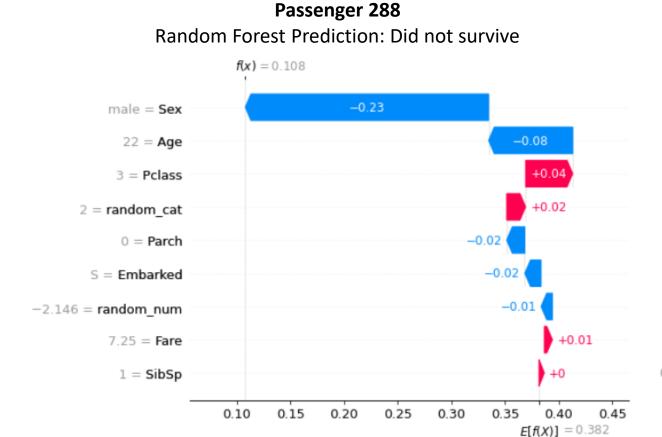

Example:

Apply feature importance techniques on a Random Forest classifier trained on the Titanic data set.

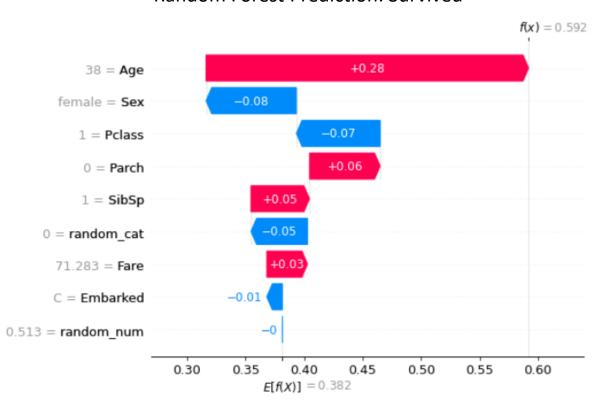

| Type of feature | Feature | Feature values |
|------------------------|-------------|--|
| | Survived | If survived or no (0 = No, 1 = Yes) (Target variable) |
| | | |
| Numeric variables | Passengerld | Unique ID of each passsenger (in integers) |
| | Age | Age in years |
| | SibSp | Number of siblings / spouses aboard the Titanic |
| | Parch | Number of parents / children aboard the Titanic |
| | Fare | Passenger fare |
| | | |
| Strings: | Name | Name of passenger |
| | Cabin | Cabin number |
| | Ticket | Ticket number |
| | | |
| Categorical variables: | Pclass | Ticket class (1 = 1st, 2 = 2nd, 3 = 3rd) |
| | Sex | Sex (string : 'male' 'female') |
| | Embarked | Port of Embarkation (C = Cherbourg, Q = Queenstown, S = Southampton) |

Example: Titanic Data Set – Local Explanations

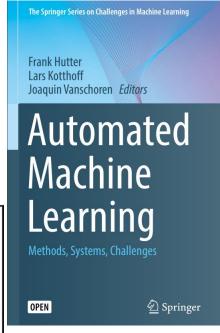

Passenger 869
Random Forest Prediction: Survived
